

Loupe turns raw case evidence into connected, source-linked intelligence.

An investigation platform for fraud and criminal casework. Investigators upload everything a case contains — documents, phone extractions, financial records, audio — and Loupe builds one connected model of the people, events, money and places inside it, where every single fact links back to the page, quote and file it came from.

WORKING BRAND • LOUPE

"FIND THE SIGNAL IN EVERYTHING."

SINGLE-TENANT • ONE INSTANCE PER CUSTOMER

CONTENTS

- 01 The problem
- 02 What Loupe actually is
- 03 One case, every lens
- 04 Raw text, elevated: highlights & Loupes
- 05 An agent that does, not a chatbot that answers
- 06 What makes this different from a straight LLM
- 07 Built like evidence infrastructure
- 08 The full capability surface
- 09 Who buys this
- 10 Ready-to-paste blocks

Modern casework is a data problem **wearing a legal costume.**

A single serious-fraud or criminal case now arrives as thousands of documents, multi-gigabyte phone extractions with hundreds of thousands of events, bank records spanning tens of thousands of transactions, and hours of recorded audio. The tools investigators have are viewers — one phone at a time, one PDF at a time, one spreadsheet at a time.

01

The connections live in people's heads

The same person appearing in a witness statement, a WhatsApp thread and a beneficiary field; the meeting that happened two streets from the cash withdrawal. Whiteboards don't scale, don't survive staff turnover, and can't be handed to a court.

02

Generic chatbots don't solve it

You can't paste a case into a context window, you can't cite a chat transcript in a brief, and you can't send evidence to a shared multi-tenant cloud.

03

The most to gain, the least able to use it

Investigation teams are simultaneously the group with the most to gain from AI and the group least able to use it off the shelf.

What Loupe **actually** is.

Loupe ingests every kind of case material through a structured pipeline and compiles it into a case knowledge graph — people, organisations, accounts, transactions, communications, events, locations, documents — held in a graph database, not a prompt. On top of that one model sit multiple investigative lenses, and an AI layer that is bounded, audited and cited rather than free-running.

Ingest

STAGE 01

PDFs (with automatic OCR for scanned pages), Office documents, spreadsheets, email, images, video, audio — transcribed and speaker-diarized, with investigator-editable speaker naming — and Cellebrite phone extractions through a dedicated forensic parser.

Ground

STAGE 02

Every extracted fact is captured as a grounded claim: subject, predicate, the verbatim quote it rests on, the exact source location, and a confidence score. Claims pass an automated verification pass and carry review status — unreviewed, uncertain, verified, rejected — into the product.

Connect

STAGE 03

Entities are resolved and de-duplicated across documents — deterministic blocking, then embedding similarity, then model confirmation — and merged into the case graph without losing provenance. A merged entity keeps the sources of everything it absorbed.

Explore

STAGE 04

The same underlying model, through whichever lens fits the question: network graph (2D and 3D), chronological timeline, geographic map, sortable table, financial ledger, phone-report viewer, full-text evidence search.

Prove

STAGE 05

Citations that open the source document at the right page. A curated “Significant” layer that projects the case down to what matters for court, and Loupes — bonded collections of evidence that turn curated items into narratives: custom timelines, evidenced sequences, explained sets. Exports to CSV, PDF and DOCX. An audit log and a complete AI cost ledger underneath.

One case, **every lens.**

Loupe meets investigators where casework actually starts — in the evidence and the day's work — with the analytical lenses one click away. Depth is there when you reach for it, never dumped on you when you open the door.

EVIDENCE

The source of truth

Folder-organised evidence explorer with case-wide full-text search, side-by-side original-and-extracted-text viewing, AI document summaries with clickable sources, previews for every format, and diarized transcript viewing.

WORKSPACE

The investigator's desk

Findings, theories with confidence levels, witness matrix, tasks, deadlines, pinned evidence, linked notes and point-in-time case snapshots.

AI CHAT

Ask with citations

Natural-language Q&A over the case — no theory required. Answers come back cited and visual: a result graph and result set alongside the text, with citations that open the document at the cited page. Context can be the whole case, the Significant layer, or a hand-picked selection.

AGENT

An investigator with tools

Describe a scenario to test and the agent works it with a visible investigation trail — gathering, cross-referencing and building durable outputs: Loupes, graphs, tables, charts, reports, maps. Detailed in section 05.

CURATION

Significance, highlights & Loupes

Investigators highlight passages, elevate entities and events to Significant, and bind them into Loupes — bonded collections of evidence, like custom narrative timelines. Every surface can project down to the curated layer instantly.

GRAPH

The network view

Force-directed graph of the whole case in 2D or 3D. Search with boolean operators, expand neighbourhoods, run pathfinding and centrality algorithms, merge duplicates with full audit, and spotlight saved subgraphs.

TIMELINE

MAP

What happened, in order

Every dated fact in the case as a filterable, clustered event stream — by event type, by entity, by range — with export.

Where it happened

Geocoded locations with confidence tiers, a needs-review queue for uncertain geocodes, heatmaps, movement trails, proximity analysis, and draw-your-own-area filtering.

FINANCIAL

Follow the money

Transaction ledger with categorisation, counterparty assignment, amount corrections with recorded reasons, sender and beneficiary flow tables, trend charts and PDF export.

PHONE

Cellebrite, cross-device

Purpose-built viewer for phone extractions: comms threads, unified contacts, location playback, files, and a cross-phone graph that surfaces shared contacts and co-occurring devices across multiple handsets.

TRIAGE

Before ingestion

Scan mounted drives, classify files against known-good and known-bad hash sets, profile users and artifacts — decide what deserves full processing before spending a cent on it.

ADMIN

Run it like infrastructure

User and role management, AI spend dashboards with a per-operation cost ledger, system logs, background task monitoring, and in-product platform updates.

Every remaining pattern, **once**.

Stat row, comparison table, claim callout, capability list and paste block — the components the product brief and the competitive landscape both need.

10k+ entities per case — dedupe design target	50k transactions per case, sub-2s filtering	35 GB single phone report, 100k+ events
3 AI providers behind one policy layer		

DIMENSION	A STRAIGHT LLM	LOUPE
Where the case lives	A context window — re-uploaded every session, forgotten after	A persistent case knowledge graph plus vector and relational stores; the model of the case outlives every conversation
Answers	Fluent, unsourced text	Cited claims — click through to the exact page; the verbatim quote, source location and confidence are stored with every fact
Model dependence	The model is the product	Models are interchangeable components behind one routing policy. The moat is the evidence layer, not the model

A straight LLM gives you a well-written opinion about the fraction of the evidence that fits in its context window. Loupe gives you a complete, permanent, cross-referenced model of all of it.

Every claim carries its receipt, every AI action is bounded and costed, and everything you find leads back to a page you can put in front of a court.

Source / product brief §06 · internal register

Court-ready reporting & exports

- Significance-based report builder assembled from the curated Significant layer
- Complete 15-section case-file export with rendered graph, timeline and map
- Isolated server-side PDF/DOCX generation with sanitized rendering
- AI-assisted content permanently visually distinguished from human findings

Evidence integrity & chain of custody

- Immutable original storage with tamper-resistant handling history
- Idempotent, resumable, cancellable ingestion jobs with stage checkpoints
- Streamed quarantine intake with malware and archive-bomb defense
- Provenance and review-status tiers preserved through merge and edit

ONE-LINER

Loupe turns raw case evidence — documents, phone extractions, financial records, audio — into one connected, source-linked intelligence layer that investigators can explore, question and take to court.

Semantic colours. The entity palette (person, organisation, location, financial, event, communication) stays stable across graph, timeline, table and report. Brand red marks focus and selection — never an entity type. Never rely on colour alone: pair it with a label.
